

GREG ORME

Greg Orme has been researching possible Martian artifacts since the early 90s. He found the Crowned Face in July 2000 which was publicized by the late Dr. Tom Van Flandern in a press conference. It then appeared in the New York Post, on Good Morning America, and Fox News special.

He also found a well known Martian Spiders image, M0804688, this was seen by Arthur C. Clarke, who discussed it many times with the media. He now claims to have proven artificiality, by uncovering 945 geometric shapes on Mars used in engineering.

Greg also has found two large hyperbolas on Mars also following a precise mathematical formula. Parabolas are used for load bearing in engineering, like a parabolic arch in old Roman buildings. Also a curve under a bridge is usually a parabola. So making any curve like this shape is very strong, less likely to crack somewhere. They seemed to have used parabolas everywhere to make hills, dams, etc stronger.

Greg states that these things are interesting but it's hard to prove they are real. The geometric evidence is mainly about proving something is artificial as a start. Then all these other things appear more plausible. Geometry can be artificial, but to prove it cannot possibly be natural is not easy. The parabolas and hyperbolas are impossible, Greg has had some agreement on this was some skeptical scientists.
